

## Motivation

### THE SEQUESTRATION LAB

The goal of the Sequestration Lab is to develop the ability to predict the spatial and temporal distribution of CO<sub>2</sub> saturation and trapping through an improved understanding of the pore and core scale physics over the life cycle of a sequestration project.

#### Focus of this work

- Model the behavior of brine displacement by injected CO<sub>2</sub> in a series of core-scale laboratory experiments.
- Better understand the fundamental physics of sub-core scale multi-phase flow
- Tough2 MP\* was used for numerical simulation (\*: developed by Karsten Pruess)

## Sub-core Scale Petrophysical Characterization

### Porosity Map Of The Core

Raw data is from X-Ray CT Scanning. The spatial variation of porosity is due to the pore-scale structure of the rock sample.

#### Capillary Pressure

$$P_{c,i} = S \sqrt{\frac{f_i}{k_i}} * J(S)$$

$$J(S) = A \left( \frac{1}{S^*} - 1 \right) + B \left( 1 - S^* \right)^{1/2}$$

A=0.040061, B=0.992531, λ<sub>1</sub>=2.183, λ<sub>2</sub>=1.077, S<sub>y</sub>=0.010036, σ=0.02247

#### Relative permeability relation

$$k_{r,CO_2} = \left( \frac{1 - S_{br}}{1 - S_{br,r}} \right)^{n_{CO_2}}$$

$$k_{r,br} = \left( \frac{S_{br} - S_{br,r}}{1 - S_{br,r}} \right)^{n_{br}}$$

n<sub>br</sub> = 1.9, n<sub>CO<sub>2</sub></sub> = 2.5, S<sub>br,r</sub> = 0.57

### CO<sub>2</sub> Saturation Measurement

(see poster by Perrin and Benson)

#### Resolution Of Simulation And Measurement

Measurement: # of pixels in y, z, x directions: 159, 159, 31  
Simulation: # of grid blocks in y, z, x directions: 53, 53, 31

## Numerical Simulations Using Different Permeability Distributions

- 1<sup>st</sup> column: Different permeability relationships to the porosity
- 2<sup>nd</sup> column: Corresponding permeability map of whole core
- 3<sup>rd</sup> column: Cross-sectional view of permeability maps
- 4<sup>th</sup> column: Cross-sectional view of saturation of CO<sub>2</sub> at steady state

#### Model a : Kozeny-Carman Equation

$$k_a = \frac{1}{3.28 \times 10^6} \frac{f^3}{(1-f)^2}$$

#### Model b : Krause's Modified K-C Equation

$$k_b = \frac{1865}{(0.3283 \times f^{0.77})^2} \frac{f^3}{(1-f)^2}$$

- From result of Krause's thin section analysis. Surprisingly, it has less contrast map of permeability

#### Model c :

$$k_c = \frac{1865}{(0.3283 \times f^{0.25})^2} \frac{f^{4.5}}{(1-f)^2}$$

- Keep the form of Krause's modified K-C equation but with different power

#### Model d :

$$k_d = a \times f^4 + b$$

a = 2653770, b = -539.841

- Try other form of permeability relationship: k is proportional to the power 4<sup>th</sup> of porosity
- have very similar result as Model c, almost identical

#### Model e :

$$k_e = \begin{cases} 1 & \text{if } f \leq 0.14 \\ 10 & \text{if } 0.14 < f \leq 0.15 \\ 30 & \text{if } 0.15 < f \leq 0.16 \\ 50 & \text{if } 0.16 < f \leq 0.17 \\ a \times f^4 + b & \text{elsewhere} \end{cases}$$

- Modified Model d to get more contrast permeability map

#### Model f : Best Model

$$k_f = \begin{cases} 1 & \text{if } f \leq 0.14 \\ 10 & \text{if } 0.14 < f \leq 0.15 \\ 30 & \text{if } 0.15 < f \leq 0.16 \\ 50 & \text{if } 0.16 < f \leq 0.17 \\ e^{m \times f^4 + n} & \text{elsewhere} \end{cases}$$

m = 64, n = -6

- Try log k is proportional to the power 4<sup>th</sup> of porosity. => extreme contrast permeability map we have

## Results / Discussion

### Permeability vs. Porosity

### Compare Saturation of CO<sub>2</sub>

- Model b has the flattest curve.
- Model f has the sharpest curve.
- Average S<sub>CO<sub>2</sub></sub> after steady state ≈ 0.12
- Lower than the experimental data (0.209)

### Compare Pressure, and Mass Fraction of Dissolved CO<sub>2</sub> in Brine

Variation of pressure and mass fraction of dissolved CO<sub>2</sub> in brine are both very small

## Results

Model with higher contrast permeability provide better results  
Making progress for improving history matching of multiphase flow experiment with numerical simulation

Improvement still needed

- By pass of portion of core observed in lab experiment will not replicated with simulation
- Capillary pressure curve
- Permeability map

## Conclusion

- Core-scale lab experiments were simulated to investigate cause of CO<sub>2</sub> saturation distribution
- Heterogeneities of porosity, permeability and saturation control the distribution of CO<sub>2</sub>
- The more contrast of permeability map, the more precise results we can get.
