

DARPA's Approach to Innovation:

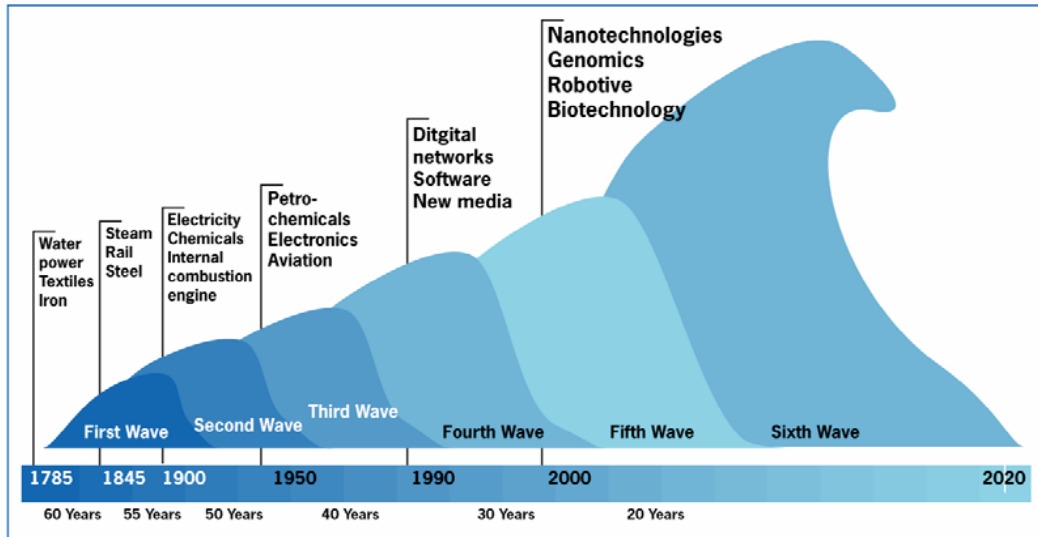

an Alternative Model for Funding Cutting-Edge Research and Development

Lawrence H. Dubois
SRI International
Menlo Park, CA

Today's Changing World: *Exceptional challenges* *... and opportunities*

Schumpeter's Accelerating Waves

Our world is

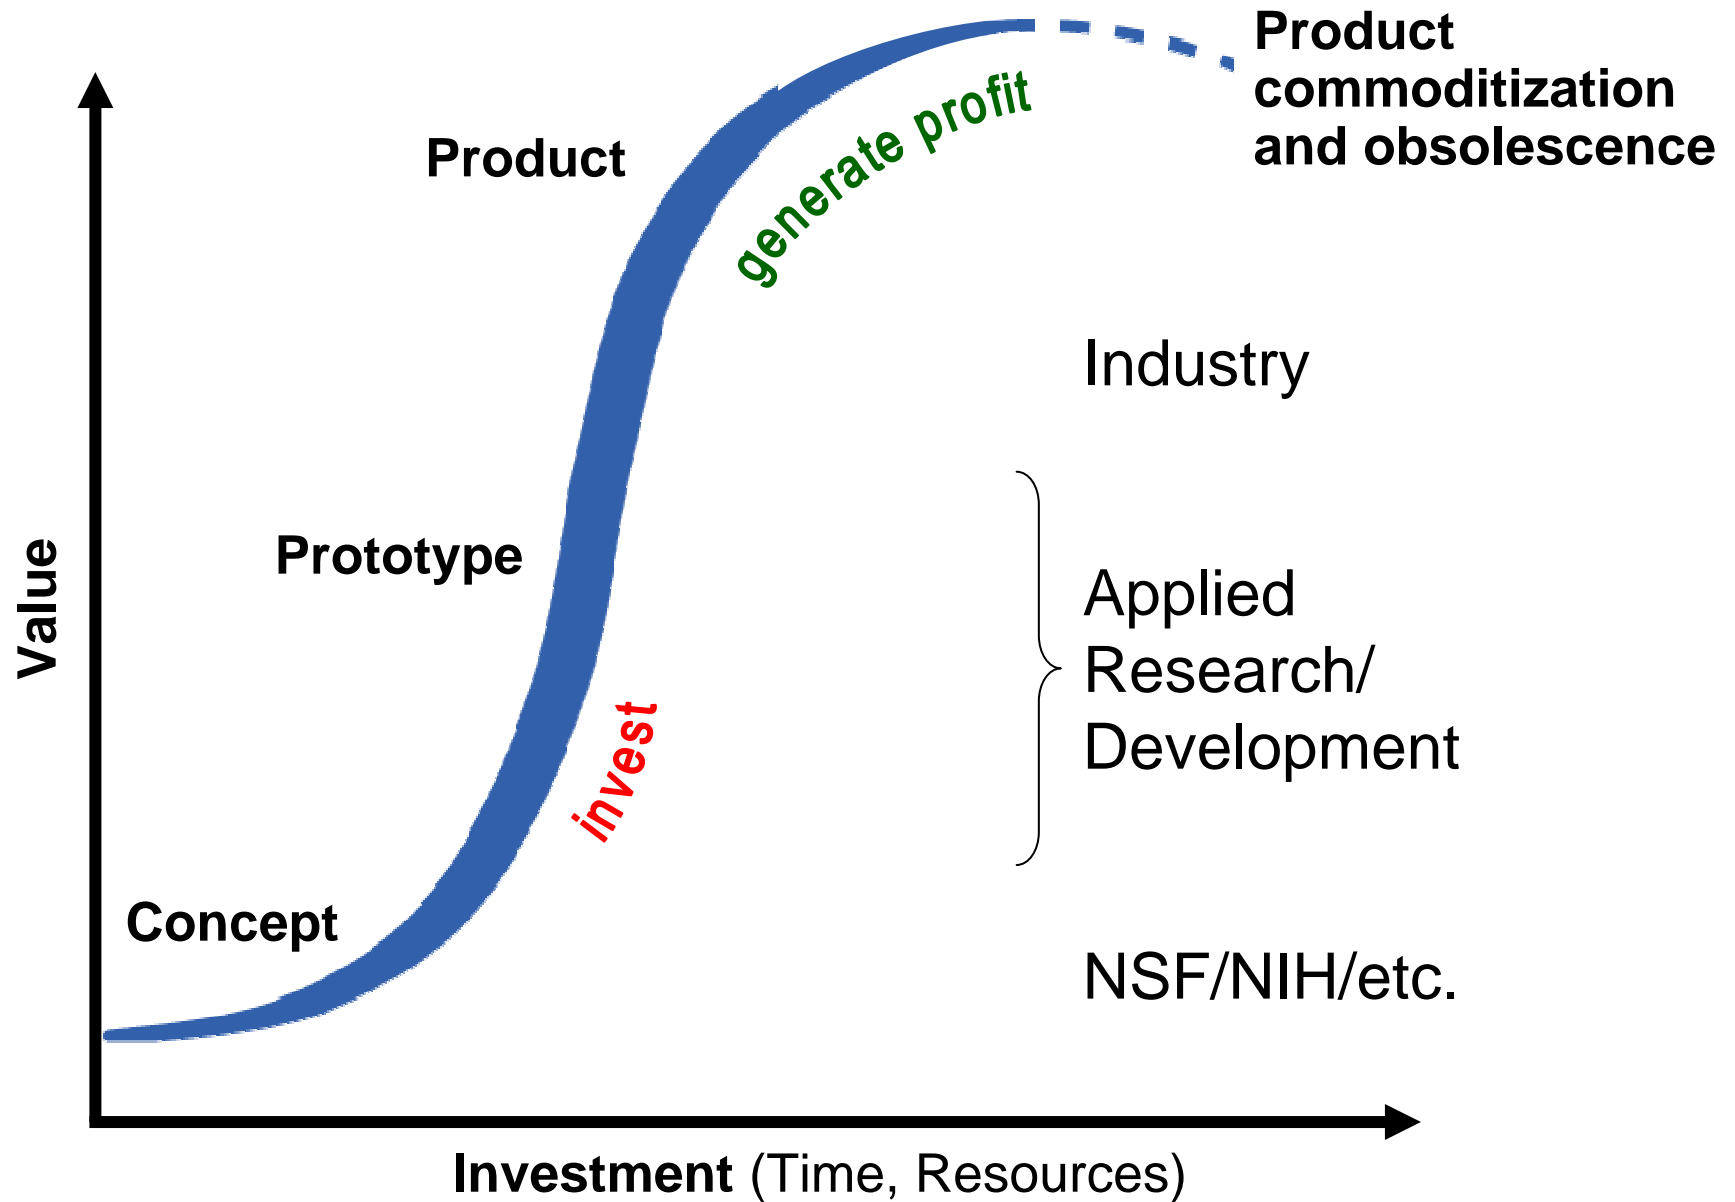

- increasingly complex and chaotic
- dynamic, accelerating
- non-linear
- increasingly multidisciplinary
- growing exponentially (e.g., Moore's Law, Metcalf's Law)

Successful innovation is not the result of luck or lone genius – rather it is the result of a disciplined, continuous improvement process with an unrelenting focus on creating the highest customer value

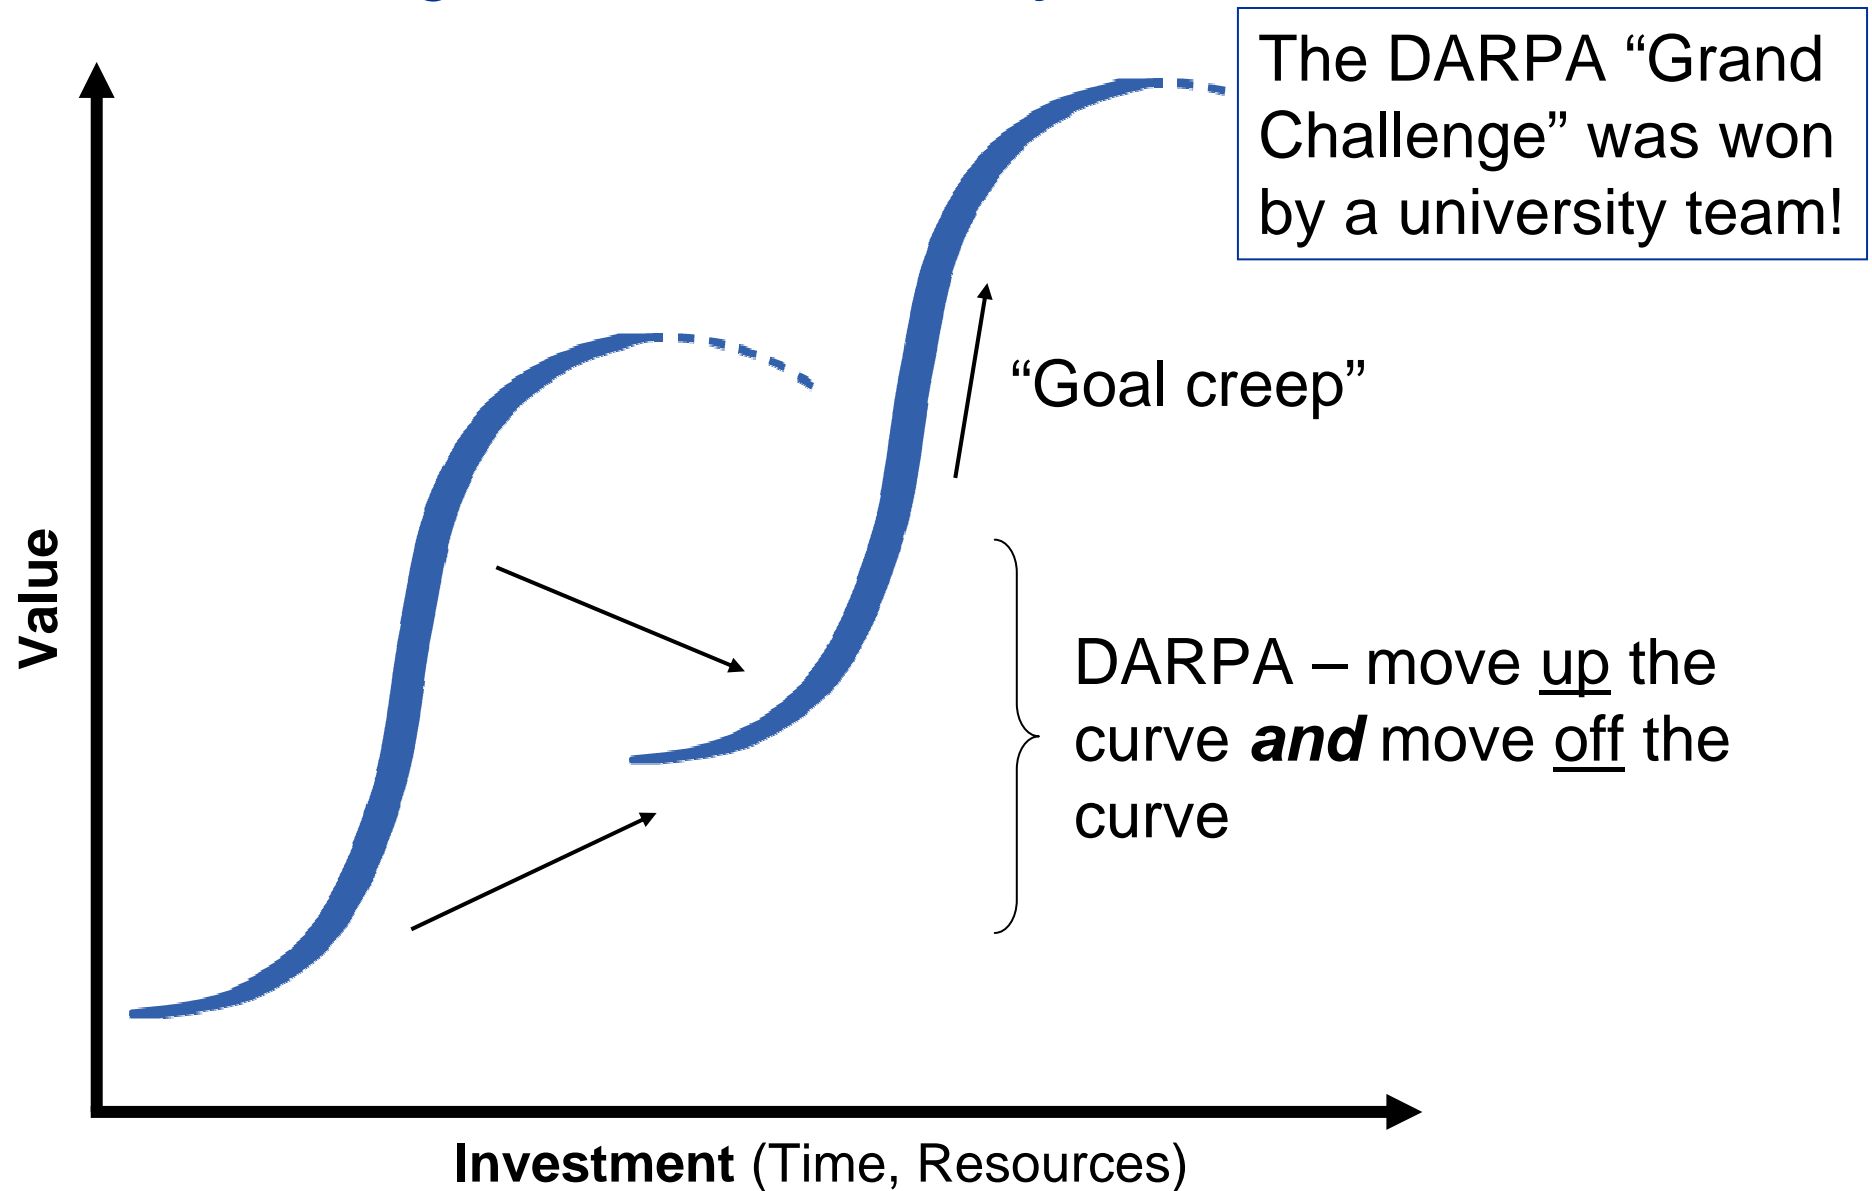

Success Requires New Ways of Operation: *DARPA*

- DARPA
 - Defense Advanced Research Advanced Projects Agency
 - Founded in 1958 in response to Sputnik
- Mission
 - Avoid technological surprise
 - Innovation in support of national security
- Focus: High-payoff technologies and military concepts with an emphasis on Joint
 - Broader horizon than commercial analogues
 - More focused than traditional university research
 - Not bound by military requirements
 - High-risk is the price to pay
- Characteristics
 - Significant authority with minimal near-term responsibility
 - Large budgets
 - Agility
 - “Top cover”

Moving up the Value Curve

Moving **Off** the Value Curve: *Making future technologies available today*

DARPA's Approach to Innovation

Strategy

- Flexibility, ability to quickly exploit emerging situations is the highest priority
- Emphasize high technical risk, high focus investments
- Competition for ideas, reward for quality performance
- An investment firm, *not an R&D lab*, no established constituency
- Methodically search for and exploit externally generated ideas
- Proactive program management

“No matter how smart you are, most of the smartest people in the world are outside your company.”
– *Bill Joy, Sun Microsystems*

Operation

- Flat, small organization, no long-term investments in facilities or themes
- Constant rotation of programs, program managers and Directors (provided by industry, other government agencies, customers)
- Highly flexible contracting and hiring capabilities

DARPA Investment Criteria

- What are you trying to accomplish?
- How is it done today and with what limitations?
- What is truly new in your approach which will remove current limitations and improve performance? By how much?
- If successful, what difference will it make?
- What are the mid-term, final exams or full-scale applications required to prove your hypothesis? When will they be done?
- What is the DARPA “exit strategy?”
- How much will it cost?

DARPA still supports *high-payoff*, core technologies

- Information Technology
- Materials, Mathematics, Biology
- Micro/nano systems
- “The Intersection of Biology, Information, Materials and Microsystems”

Defense Sciences Office: *In Practice*

Respond to technological opportunity (“Miracle Identification”)

- Program Manager must be a proactive “Techno-Scout”
- Catalyze the creation of new technologies
- Focused effort, clear understanding of military needs
- Proactive: technical and fiscal flexibility

Emphasize a multidisciplinary technical approach

- Office is technically diverse
- Teaming of universities, Service and federal laboratories, small businesses, large industry, etc.
- Mixed risk – combine basic, applied research and development
- Seek opportunities at interfaces between conventional disciplines

Recognize defense / commercial industry as customer

- Military as consumer
- Work synergistically with industry (e.g., consortia, cost share, etc.)
- Always conscious of an exit strategy

3-D Chessboard Analogy to Program Management

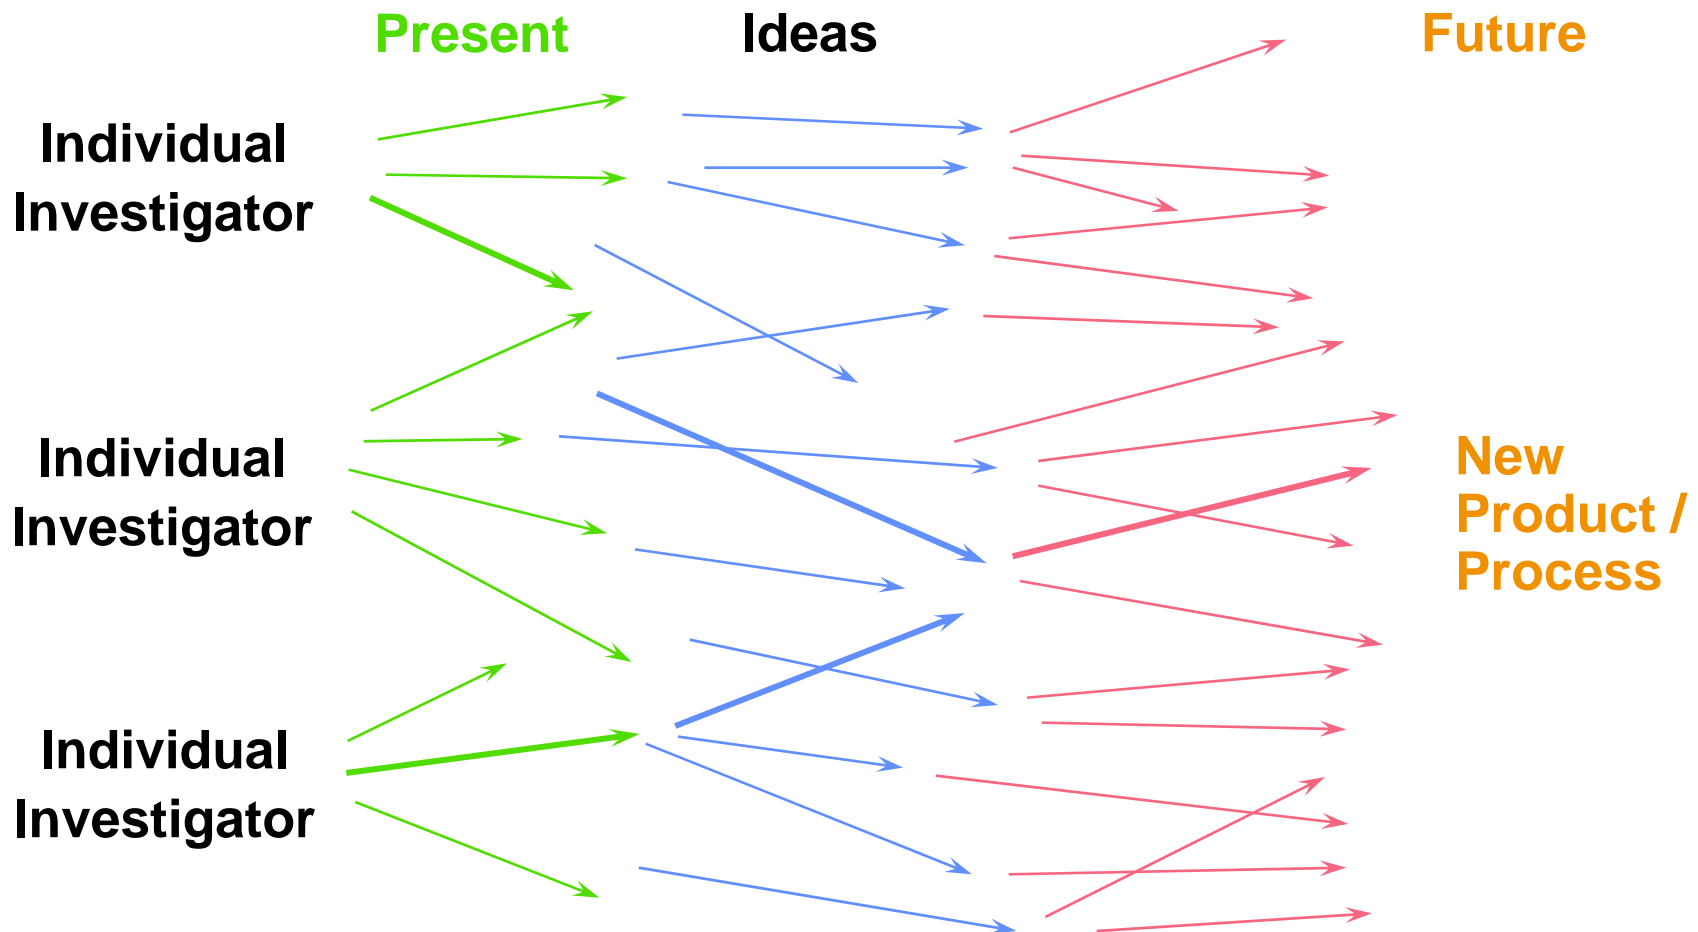

- You know what the goal is -- *checkmate!*
- Start off with many different pieces in different places and with different capabilities (all useful)
- Coordinated attack (e.g., teaming)
- Moving target (e.g., customer demand)
- Changing obstacles and opportunities
- The game is won by the *proactive* player

So how does one get it right?

Technology Development: *Typical Approach*

Individual research leads to a vast array of potential technologies and discoveries, only a fraction of which are combined to form useful new products / processes.

A Roadmap to Research is NOT the Answer

Good Points

- Plan from A to B
- Path around obstacles
- Provides direction
- Defines distance

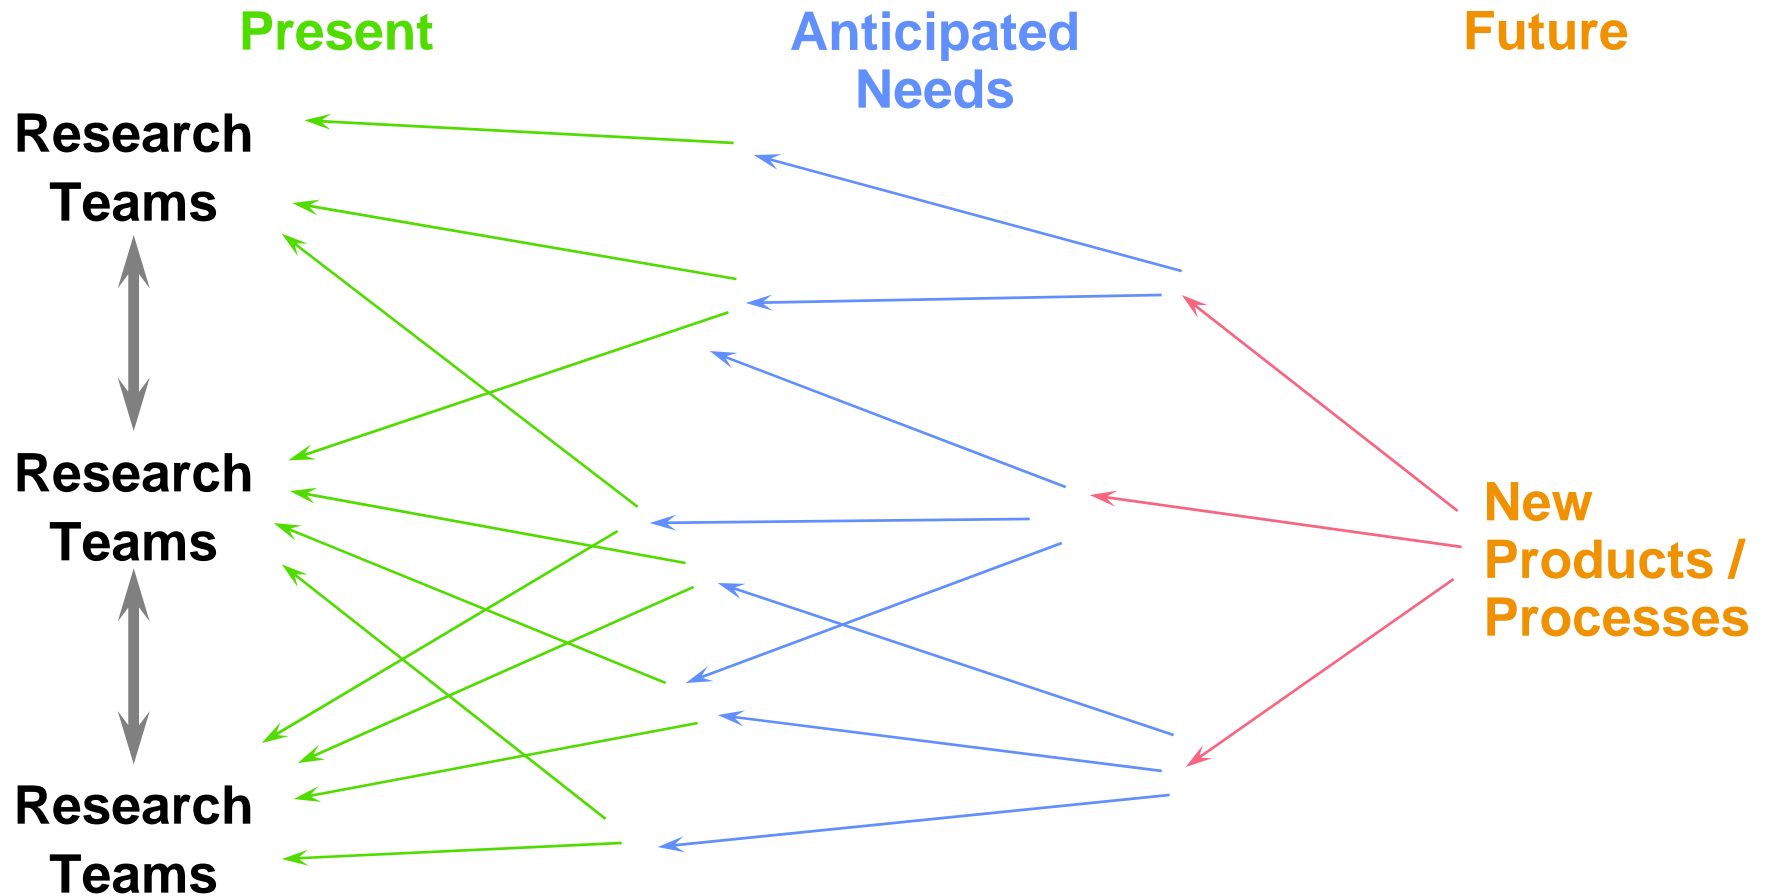

But ...

- Assumes everyone starts from the same place
- Assumes the destination remains fixed
- Assumes no new roads will be built (or that an airplane will be invented)
- No time information

DARPA's role is to build that airplane!

Technology Development: *End-game Approach*

By first defining the desired product / process and the anticipated technology needs, research teams can better coordinate their efforts and a higher rate of return on technology development can be realized *faster*.

Direct Methanol Oxidation Fuel Cells: *Research and Development Issues*

Catalyst Formulation
 Catalyst Synthesis
 Surface Chemistry
 Support Effects
 Anode Kinetics
 Cathode Kinetics
 Reaction Mechanism
 Membrane Synthesis
 Membrane Transport
 Properties
 Theory
 Modeling
 In situ Diagnostics
 Electrochemical Corrosion

Methanol Crossover
 Catalyst Performance
 Catalyst Fabrication
 Carbon Support
 Membrane Performance
 MEA Fabrication
 Pressurized Operation
 Methanol Concentration
 Fluid Flow
 Heat Transfer

Catalyst Performance
 Methanol Crossover
 Membrane Performance
 MEA Fabrication
 Optimum Temperature
 Optimum Fuel

Catalyst Deactivation
 Corrosion
 Water Management
 Membrane Stability
 Fuel Impurities

Low-Cost Separator Materials
 Low-Loaded/Low-Cost Catalysts
 Low-Cost Membranes
 MEA Fabrication
 Simple Assembly
 Balance-of-Plant

Team:

- Universities
- Industry
- Federal Labs
- Small Businesses

Increase Power Density

Increase Efficiency

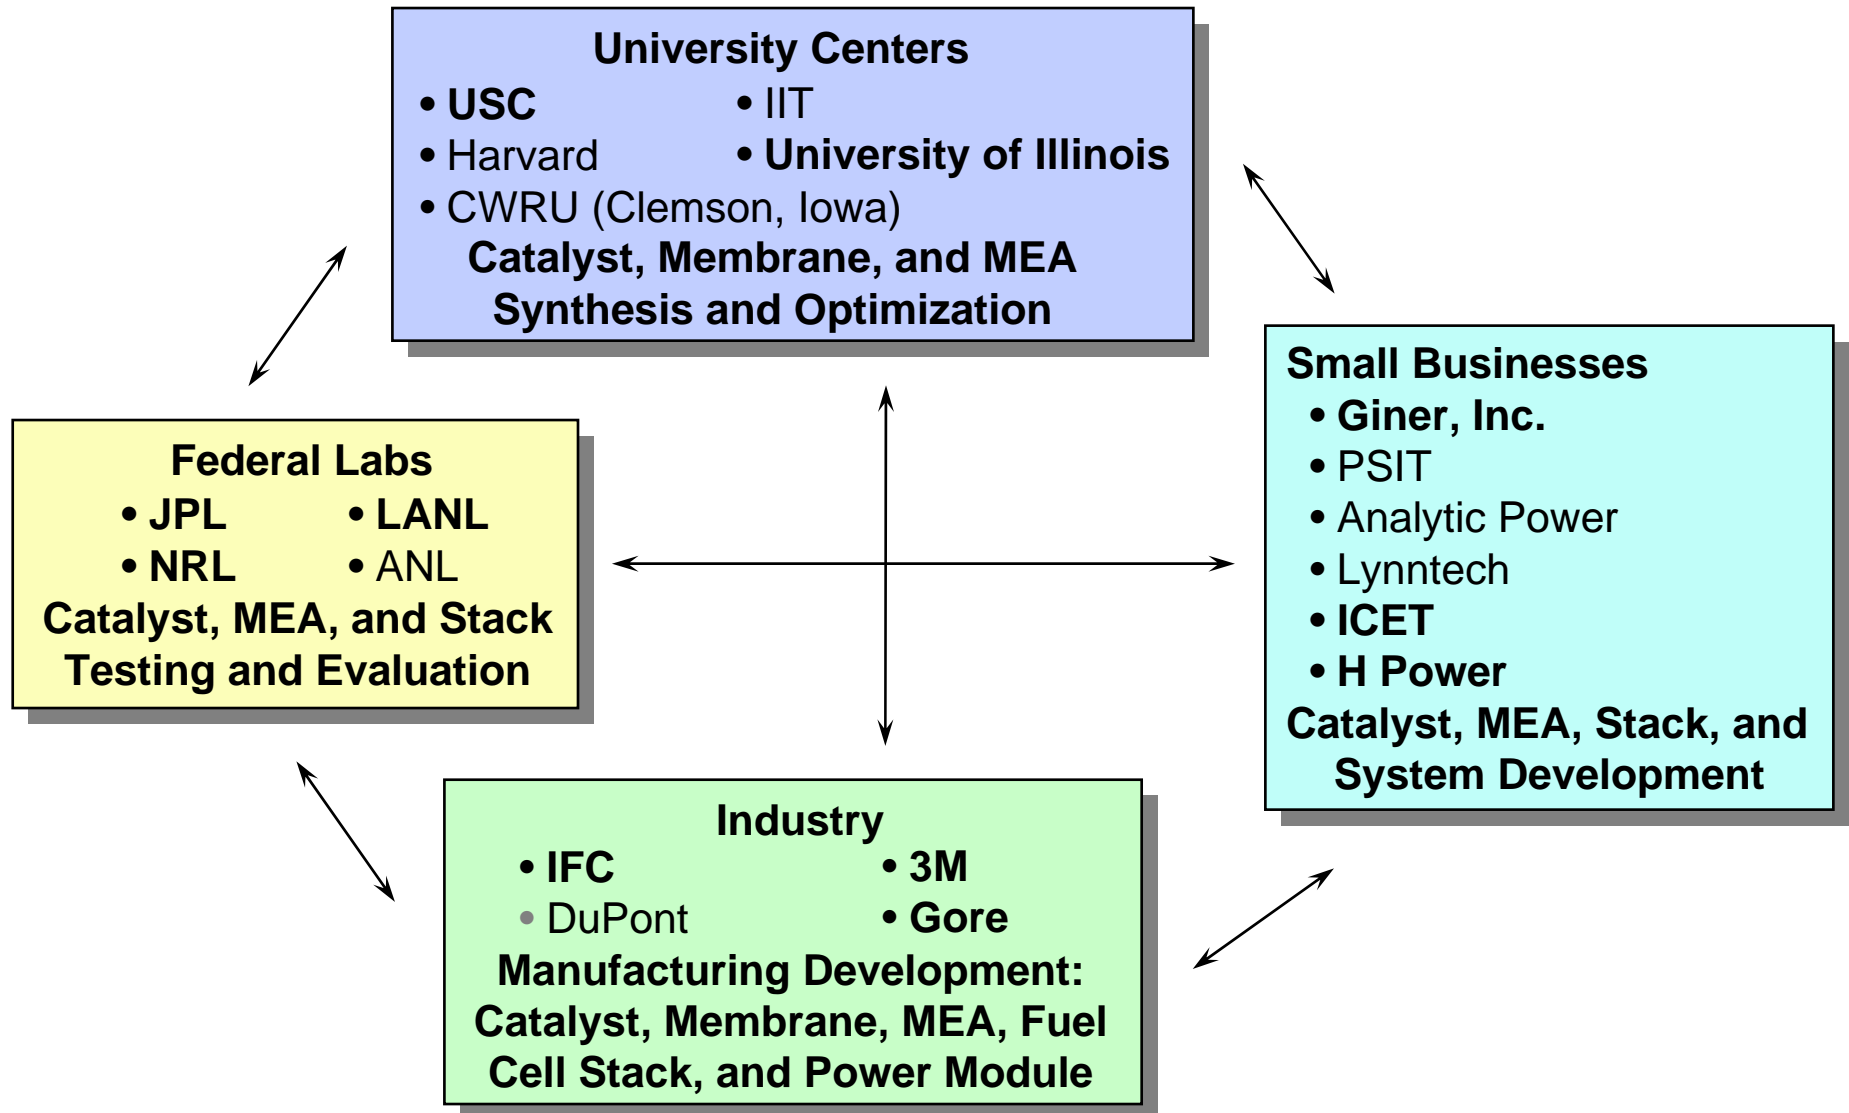

Improve System Life

Decrease Cost

Direct Methanol
 Oxidation Fuel Cell

DARPA Direct Methanol Fuel Cell Program: *Team Approach (“Cooperation”)*

Micro Air Vehicle Development: *Overstressing the system*

Potential Missions

- Surveillance/reconnaissance
- Communications
- Chem/bio sensing

Components

- Motors/batteries
- Sensors
 - Camera
 - Infrared
 - Radar
 - Chem/bio
- Radios
- GPS
- Gyros/control systems
- Software

Micro Air Vehicles: *Reality*

1 hour, 47 min
flight time

Visible Imagery

Human Piloted

Self-stabilized

Pitch angle (°)

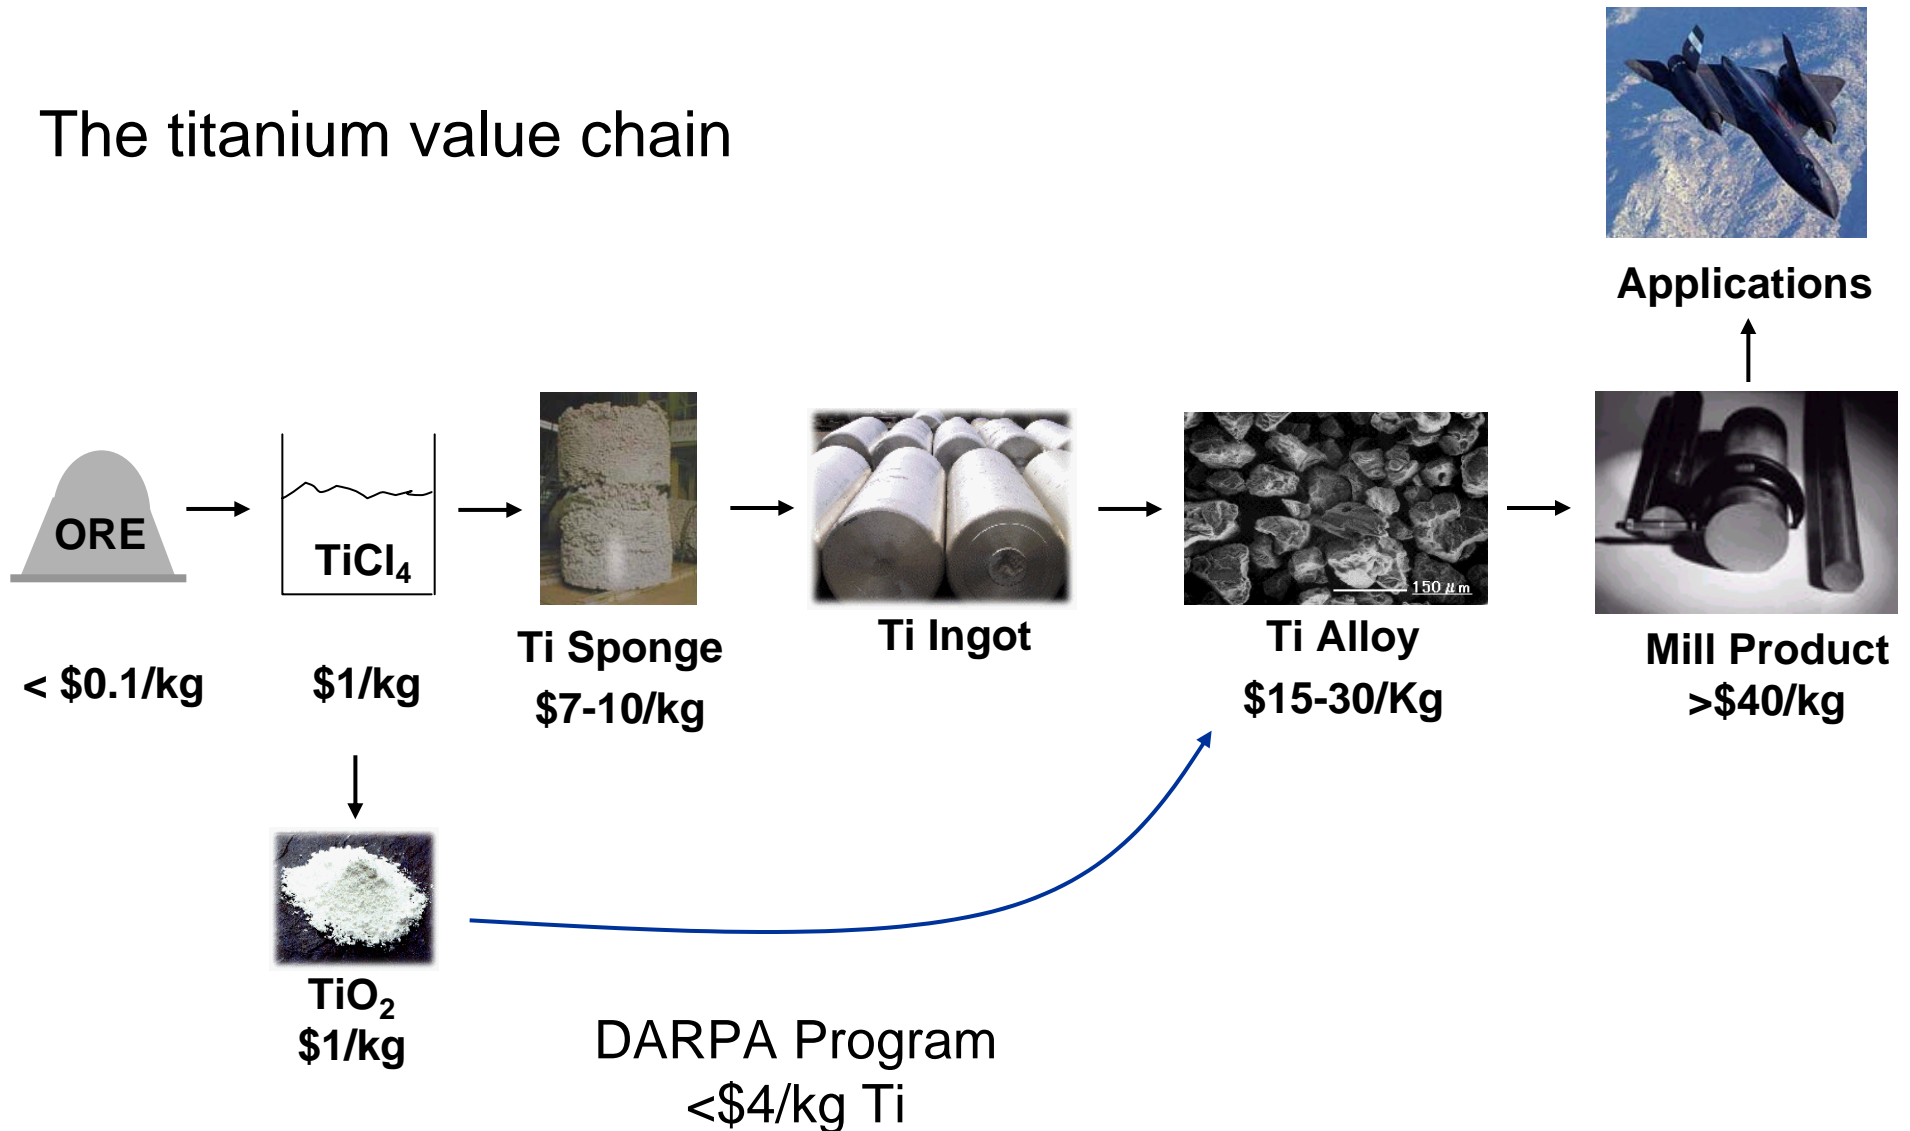

The Next Generation: *Nano Air Vehicles*

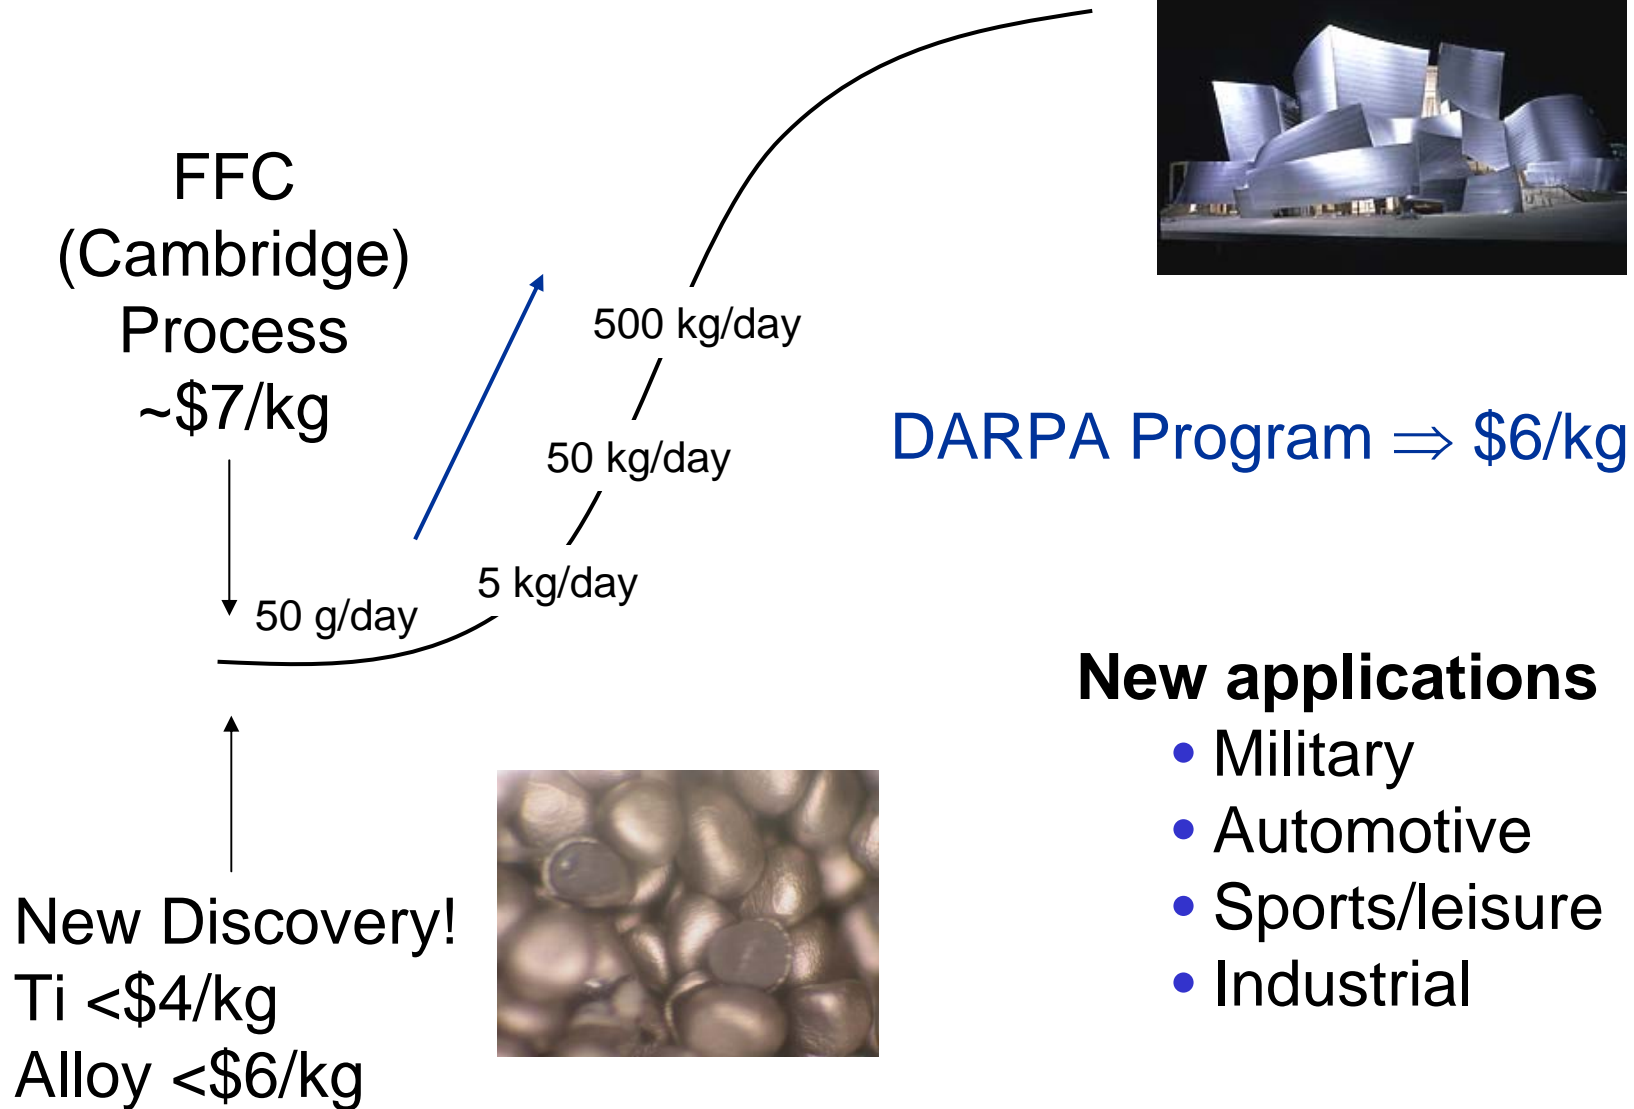

- **Goals**
 - 7.5 cm maximum dimension
 - 10 gram total weight with 2 gram payload
 - 1000 m range at 5 – 10 m/sec and return
 - >60 second hover
- **Develop and demonstrate**
 - Aerodynamic design tools
 - Lightweight efficient propulsion and power
 - Navigation, communications and control
 - Advanced manufacturing and packaging

Low-cost Titanium Production: *Stimulating new ideas and new applications*

The titanium value chain

Stimulating the Discovery Process

Universities Stepping up to the Plate: *Very High Efficiency Solar Cells*

- Demonstrate at least 50% efficiency in a photovoltaic device based on nanoscale, inorganic, three-dimensional meta-structures
- Deliver at least 1,000 units, 10 cm² per device, producing at least 0.5 W each with a standard solar fluence of 1 kW/m²
- Team
 - Lead: University of Delaware
 - 15 Universities and industries
 - \$33.6M from DARPA + \$19.3M cost share

Tech Transfer into the Military is a *Real* Challenge

- Scientists are trained to
 - Postulate hypothesis describing some aspect of the physical world
 - Design an experiment to test the hypothesis
 - Measure outcomes, analyze, etc. and ***iterate***
- Military understands that experimentation is necessary, *but doesn't know how to experiment*
 - Military cannot fail – it must always win
 - Military trains and conducts demonstrations, not experiments
 - Military must have a predictable outcome – ***success***

Successful technology transfer requires iteration with the user

Summary

- DARPA is a mission oriented agency with a focus on projects *not* programs
 - Combine basic research, applied research, development and demonstration – “mixed risk” portfolio
 - Program managers have the technical and fiscal authority to steer efforts – more important than money
 - Strong connection with the user community
 - Successful performers must be flexible
- Today’s important problems are inherently multidisciplinary and hence require a team approach
 - Funding is generally larger than from NSF, DOE BES, NIH, etc.
 - Deliverables (more than reports) are expected
 - Projects may not last the full “lifetime” of a graduate student
- University researchers have been successful in winning and leading major DARPA projects

Keep a *realistic* perspective!

GRANTLAND®

SO I WANT YOU HERE IN R+D
TO FORGET THE SHORT TERM.
FORGET TRYING TO PRODUCE
PRODUCTS. CONCENTRATE ON
BASIC RESEARCH.
