

## **Energy Systems Analysis**

A full description of the results of technical activities conducted under the Energy Systems Analysis program is provided in the accompanying technical report. The Systems Analysis work has focused on building an interactive web application based on the Exergy and Carbon Flow charts developed last year. The charts have generated interest from many of the students and professionals with whom GCEP interacts. The charts, and the data that they contain, have been the basis of several GCEP presentations that illustrate the the level of complexity in the energy system. The team has made significant progress in automating access to, and visualization of, the data.
